Danielle N. Davis

Dominican University of California, Department of Psychology

Introduction

- Minority college students are at increased risk for negative mental health outcomes and self-esteem issues considering acculturative stress and perceived discrimination (Gomez et al., 2011).
- How discrimination is viewed by the individual and how they adjust to dominant culture plays an important role in self-esteem (Hall et al., 2015).
- Studies following the relationship between perceived discrimination and acculturative stress rarely look into mental health outcomes along with self-esteem (Paukert et al., 2006; Wei et al., 2013).
- This research may provide insight into the mechanisms which affect psychological distress (Tonsing et al., 2016).

Hypotheses

Hypothesis 1: Minority students with higher levels of perceived discrimination will be more likely to experience anxious symptoms and low self-esteem than minority individuals with lower levels of perceived discrimination (PD).

Hypothesis 2: Minority student with higher acculturative stress levels will be more likely to experience anxious symptoms and low self-esteem than minority students with lower levels of acculturative stress (AS).

Hypothesis 3: Overall Black and Hispanic/Latinx students will report higher levels of perceived discrimination and acculturative stress than Asian students.

Methodology

Ethnicity of Participants

Participants

- 65 total participants
- Students from small liberal arts college in Northern California
- Snowball sample from social media
- Ages 18–28 ($m = 21.6$)

Methodology

Measures

Perceived Ethnic Discrimination Scale

The Perceived Ethnic Discrimination Questionnaire-Community Version (Brondolo et al., 2005). The PEDQ-CV was utilized to capture the levels of perceived discrimination experienced by a participant throughout their lifetime on a 5-point Likert scale

Self-Esteem Scale

The Rosenberg Self-Esteem Scale (Rosenberg, 1965): The RSES was used to assess self-esteem of the participant on a 4-point scale

Anxiety Measure

The Beck Anxiety Inventory (Beck, 1965): The BAI was used to assess anxiety levels for each participant, based on symptomology in the past week on a 4-point scale

Acculturative Stress Measure

The Social, Attitudinal, Familial, and Environmental Acculturation Stress Scale-Short Version (Mena et al., 1987): The SAFE scale was used to assess acculturative stress levels in each participant on a 5-point Likert scale

Results

Perceived Discrimination and Mental Health

Positive Correlation between perceived discrimination and self-esteem ($r(60) = .264, p < .05$)

Positive Correlation between perceived discrimination and anxiety ($r(60) = .382, p < .01$)

Results

Acculturative Stress and Mental Health

Positive Correlation between acculturative stress and self-esteem ($r(60) = .360, p < 0.01$)

Positive Correlation between Acculturative Stress and anxiety ($r(60) = .426, p < 0.01$)

Outcomes across Racial Groups

No significant difference found in acculturative stress levels ($t(57) = 2.246, p > .05$)

Marginally significant difference found in perceived discrimination levels ($t(57) = 1.042, .1, p = .029$)

Results

Post Hoc Analyses

Filipino V. Black & Hispanic Measures

No Significant difference between Black & Hispanic and Filipino levels of perceived discrimination ($t(45) = -.959, p > .05$) or acculturative stress ($t(45) = 2.32, p > .05$)

- Filipino levels of perceived discrimination were closer to that of Black & Hispanic participants than the Asian group as a whole

Discussion & Conclusion

Discussion

- Previous research has found that increased levels of perceived discrimination is positively correlated to anxiety and lower self-esteem. Findings in this study were consistent with previous research.
- Research conducted on acculturative stress has found that the stress has positive correlations to anxiety and self-esteem in minority individuals. This was confirmed within this study.
- Prior studies rarely compared perceived discrimination and acculturative stress levels between racial groups. This study found a marginally significant difference between groups on perceived discrimination which is slightly different than the previous findings.

Limitations

- Recruitment relied heavily on a snowball sample from social media.
- Questions were all retrospective, relying on the memory of the participant for responses

Future Directions

- There should be more research done to view the long-term effects of these negative mental health issues related to PD & AS
- Future research should compare across groups besides Asian, Black, and Hispanic groups
- More research should go into looking at multiple ethnic groups within one racial group, No racial group is a monolith and looking into difference within the group can also be helpful to finding solutions to prevalent issues
